EXPERIMENT- 04: Find the Last Connected USB Device Using USBDeview

AIM:

To identify the last connected USB device on a Windows system using USBDeview and examine its connection details for forensic investigation.

REQUIREMENTS:

1. Windows computer
2. USBDeview utility
3. Administrative privileges if required to access certain device information

PROCEDURE:

Step 1: Download USBDeview

1. Visit the official NirSoft website: https://www.nirsoft.net/utils/usb_devices_view.html
2. Download the appropriate USBDeview package.
3. Extract the downloaded files and launch USBDeview.exe.

Step 2: View USB Devices

1. Run USBDeview on the target Windows system.
2. Allow the utility to display currently connected and previously connected USB devices.
3. Review the device list and identify USB storage devices.

Step 3: Examine Device Details

1. Inspect the following fields for each relevant device:
2. Device name and description
3. Device type
4. Serial number, if available
5. Vendor ID and Product ID
6. First connection and last connection timestamps, where available
7. Current connection status

Step 4: Identify the Last Connected USB

1. Locate the Last Plug/Unplug Date or corresponding last-connection field.
2. Sort the device list by that field, if supported by the installed version.
3. Identify the most recent connection event.

imestamp and device details ds when necessary.

5. Record the device information for the lab report.

Step 5: Document the Findings

1. Record the device name, serial number, vendor ID, product ID, connection timestamp, and current status in the observation table. Capture a screenshot showing the relevant USBDeview entry.

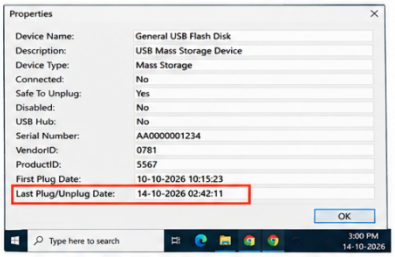

Figure 4: USB Device Details (Last Connection Time)

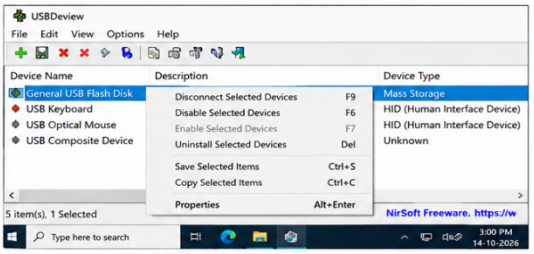

Figure 5: USB Options (Disable/Uninstall/Properties)

RESULT:

1. USBDeview successfully displayed a comprehensive list of USB devices connected to the system.
2. You obtained critical forensic information like the last connection timestamp, device serial numbers, and manufacturer information.
3. This data helps trace and verify USB device usage history on the system, supporting forensic investigations involving removable media.
